

## Topical Pre-operative Skin Expansion - Leiomyosarcoma Back

### History

Twenty-five-year-old female considered by the surgeon to be a difficult case. Complicated by neo-adjuvant radiation and prior resection with positive margin, resulting in less available skin and a loss of natural elasticity of the surrounding skin.

Pre-operative application for 5 days.

Post-op primary closure after wide excision in radiated field. Margins widely clear.

Follow-up photo.
